1. Introduction

The P015 is a serial GPIO and the P016 is an I2C PIO. This is supplied and an IC but there is also a PCB.

The GPIO has 8 general purpose pins that can be set to wither input or output. It also has 4 high frequency Pulse width modulated outputs for power control. All of these can be conveniently be controlled with 2 wires(serial or I2C)

Conveniently this will enable 5V i/o from a 3.3V device, also it will isolate the host from any potential damage.

More data and examples with free software can be found at www.pichips.co.uk

2. Features

- Wide voltage range 2.5V to 5.5V
- 8 GPIO
- 4 PWM
- Simple serial or I2C protocol
- User configurable EEPROM

3. Electrical interface

The IC is a 20 pin DIL for ease of use and has two versions:

1	+V	Gnd	20
2	PWM-1	IO-8	19
3	IO-1	IO-7	18
4	Reset	PWM-4	17
5	PWM-2	IO-6	16
6	IO-2	IO-5	15
7	IO-3	IO-4	14
8	PWM-3	n/c	13
9	F	RX	12
10	TX	n/c	11

P011 Serial IC

1	+V	Gnd	20
2	PWM-1	IO-8	19
3	IO-1	IO-7	18
4	Reset	PWM-4	17
5	PWM-2	IO-6	16
6	IO-2	IO-5	15
7	IO-3	IO-4	14
8	PWM-3	SDA	13
9	F	n/c	12
10	n/c	SCL	11

P012 I2C IC

There are two versions of the IC, the only electrical difference is that one has TX,RX pins and the other has SCL, SDA pins.

3.1. IC Pin out

Pin	Description
1	+V, this can range from 2.5V to 5.5V
3, 6, 7, 14, 15, 16, 18 & 19	Digital inputs or outputs set by the user
2, 5, 8 & 17	PWM outputs that can be controlled from 0 to full power. The PWM operates at 32kHz
4	Reset, This must be tied to +V, taking this low will reset the IC. It can be tied to a resistor if a reset needs to be implemented. The IC will reset on power up.
9	F this must be tied to +V for normal operation
10	TX (output) line for serial devices no connection for I2C devices
11	SCL (clock) for I2C devices, no connection for serial devices
12	RX (input) for serial devices no connection for I2C devices
13	SDA (data) line for I2C devices no connection for serial devices
20	Ground

IC pin out Table for P017/8

I2C or Serial GPIO with PWM

P015/6

For correct operation Pins 4 and 9 must be tied to +V.

3.2. The F pin

The IC is controlled by values in the EEPROM and it may be possible that the user could change critical values that would stop the IC from communication. If this happens:

- 1) Remove power
- 2) Tie pin F to ground
- 3) Apply power
- 4) Remove power

This procedure will restore the first few bytes of EEPROM that will restore normal communications using the default address.

3.3. I2C

The I2C interface is the standard arrangement, somewhere along the bus a pull up resistor is required for the SCL and SDA lines.

The default device address is 0x6C(8 bit) or 0x36 for Rpi and Arduino

3.4. Serial

The serial interface is a standard 1 start bit 8 data bits and 1 stop bit and is initially set to 9600 Baud. This is user changeable from 2400 to 115200 in 8 steps.

The interface can be connected to a UART or USB to serial device and expected the voltage to be TTL levels (0 and 5V or 0 and 3.3V). By default and when connecting directly to one of the above devices the output (TX) is correct for a single device.

There is an opportunity to have more than one device share the TX line and this is achieved with an open collector circuit. The circuit diagram of the PO17 PCB shows how this can be achieved. When using this circuit the output (TX) requires inverting and this is done via a setting in the EEPROM.

By default the serial interface is set at 9600 Baud and the serial device address is 'l'(lower case L).

4. GPIO

Any of the GPIO pins can be set to either input or output. The voltage must not exceed that on +V

5. PWM Output

There are 4 PWM output pins. On full power these will be high and on zero power these will be low. Power levels between these two values will produce an appropriate pulse width.

6. Using the PCB

The device can be used with or without the PCB, it is however a very convenient way of using the device.

Full instructions for assembling the PCB are given at www.pichips.co.uk

The PCB is designed for various IC's and so this data sheet will cover the options specifically for the P015/6

6.1. Sideways Stackable Connectors

The PCB provides a pin (left hand side) and socket (right hand side) arrangement. This will allow many PCB's to be stacked together to form a system.

The pins and socket are connected through on a 1:1 arrangement.

I2C or Serial GPIO with PWM

P015/6

same serial bus without a clash of the TX lines.

The +L pin goes to pin 20 of the IC and is therefore the main supply. The +V pin does not go to any part of the IC.

6.2. I/O Connector

2	4	6	8	10	12	14	16
1	3	5	7	9	11	13	15

Pin Numbering Layout

Pin	Connected to
1	IO-1
2	PWM-1
3	IO-3
4	IO-2
5	PWM-2
6	PWM-3
7	IO-4
8	IO-5
9	IO-6
10	PWM-4
11	IO-7
12	IO-8
13	+L
14	+V
15	GND
16	GND

I/O Connector Table

6.3. Serial Circuit

This circuit has two features:

- 1) It has been specially designed for use with 5V and 3V3 hosts. The device can be operated at 5V but still be connected to a 3V3 host without fear that the TX pin will be outputting 5V as this is clamped to 3v3 by the diode.
- 2) The output transistor is effectively an open collector device, this makes it possible to use many devices on the

I2C or Serial GPIO with PWM

P015/6

7. Circuit Diagram of the P0nn PCB

I2C or Serial GPIO with PWM

P015/6

8. Command Set

Default address, serial ('h') I2C (0x34, 7bit)

The commands are sent to the serial interface byte by byte, however for convenience the byte values chosen coincide with ASCII characters. This makes debugging on a terminal very easy.

All commands will be referred to by their ASCII value but remember on a microcontroller host system, sending 'a' on a terminal is just the same as sending the value 97.

Where appropriate all of the serial commands listed in the summary table below have an I2C equivalent.

The full command details are listed later on in the text.

Command Set Summary	
s (1)	Sets either input or output
w (2)	Sets weak pull ups
g (3)	Gets whole byte
o (4)	Sets whole byte
p (5)	Sets an i/o pin
i (6)	Inputs from an individual pin
m (7)	Sets a pwm pin
W (0x91)	Write to EEPROM
R (0x90)	Read from EEPROM
I	Invert TX
C (0x95)	Reset
D (0xa1)	Device ID number
V (0xa0)	Firmware Version
H (0x96)	Hello

Table 1 Command Set summary (I2C)

All of the above commands require a device address to be specified before sending the command and also **every serial command sequence must be terminated with CR** ("\r") (13) (0xd).

Serial:

The device will return ACK (6) on all successful commands and NACK (21) on unsuccessful commands.

Any command beginning with an address that does not match the devices address is ignored.

I2C:

Follows the normal I2C rules.

9. EEPROM values

The EEPROM contains important values that control the way the device behaves. All of the values can be changed by the user using the 'W' command.

The EEPROM consists of 255 bytes and in general the first 16 bytes are used by the system, the second 16 byte are used by the device and the rest of the bytes can normally be used by the user.

Adr	Default Value	Description
0	0	System Use
1	112	Device address
2	6	ACK value
3	21	NACK value
4	3	Baud rate
5	1	Error reporting 1 = on
6	13	End of line
7	1	Invert TX 1=invert
14	112	Device address copy
16	0	PWM Time base
250	112	Device address copy

Table 2 EEPROM use

The user is free to use any locations that are not occupied by the system but for future use it is best to avoid locations below 32.

EEPROM values are only read on start up so when changing values they will not normally take effect until the device is reset.

9.1. Address

These EEPROM locations contains the device address. By convention the address is set to values between the values 97 to 122, no checking is made by the device so setting values outside this range may or may not work.

For security the address is stored in three places and to change the address of the device at least two of the locations need to be set otherwise the device will detect the anomaly at start up and revert to the majority value.

Normally to change the address of a device locations 1 and 14 are both changed. The device will detect this at start up and change the address in location 250 to match.

9.2. ACK character

By default this is 6 but can be changed using the EEPROM Write command. The effect will not be implemented until the device is reset.

I2C or Serial GPIO with PWM

P015/6

9.3. NACK character

By default this is 21 but can be changed using the EERPOM Write command. The effect will not be implemented until the device is reset.

9.4. Baud Rate

The Baud rate has the following values:

0. no valid
1. Baud rate is fixed at 2400
2. Baud rate is fixed at 4800
3. Baud rate is fixed at 9600 (default*)
4. Baud rate is fixed at 14400
5. Baud rate is fixed at 19200
6. Baud rate is fixed at 38400
7. Baud rate is fixed at 57600
8. Baud rate is fixed at 115200

9.5. Turn off Error reporting

By default error reporting is enabled and this will be reported and an output prefixed by Error, for example **Error 2**. This may get in the way of the program trying to control the device and so it can be disabled with this command. The effect will not be implemented until the device is reset. This does not apply to I2C if available.

9.6. CR Character

By default this is 13 which is the standard ASCII CR and the whole protocol relies on this being at the end of every command. It may be that this is unsuitable in some systems and so this can be changed.

9.7. PWM Time Base

Sets the PWM time base using the following values:

- 0 = 32kHz
- 1 = 8kHz
- 2 = 2kHz
- 3 = 500Hz

Other values will give unpredictable results but will be one of the above.

I2C or Serial GPIO with PWM

P015/6

10. Commands

All serial commands are preceded by an address and terminate with CR (0xd). In the examples given below the address is 'l'(lower case L) or 0x6C (0x36)

When a command is accepted by the device it always returns ACK which by default is the value 6. If the device rejects the command then it will return NACK, value 21

Serial	I2C	range	Default Value	EEPROM Location	Description																
sp,d	1,p,d	p 1-8 d 0-1	(all inputs)		<p>Set pin for input or output</p> <p>sets the channel (pin) 'p' to be either an input or output. If d is 0 then it is an output, if 1 it is an input.</p> <p>Examples:</p> <p>Set IO-3 to be an output</p> <p>ls3,0</p> <p>I2C</p> <p>s 1 3 0 p</p> <p>or</p> <p>bus.i2c(0x36,[1,3,0],0)</p> <p>See www.pichips.co.uk and 'notsmb' for an explanation of the above nomenclature.</p>																
wp,d	2	p 1-8 d 0-1	(all enabled)		<p>Sets a weak pull up on the specified pin</p> <p>Each pin can either have a weak pull up applied or not. This ONLY applies to input pins and can save having to use external resistors. A switch for example need only pull the pin to ground.</p> <p>0 turns the pull up off an 1 turns it on. By default the pull ups are on.</p> <p>Examples:</p> <p>turn the pull up off on pin 7</p> <p>lw7,0</p> <p>s 2 7 0 p</p> <p>or</p> <p>bus.i2c(0x36,[2,7,0],0)</p> <p>See www.pichips.co.uk and 'notsmb' for an explanation of the above nomenclature.</p>																
g	3				<p>Get whole byte</p> <p>This will return a value that reflects the pin values as one byte:</p> <table border="1"> <thead> <tr> <th>IO8</th> <th>IO7</th> <th>IO6</th> <th>IO5</th> <th>IO4</th> <th>IO3</th> <th>IO1</th> <th>IO1</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>0</td> <td>0</td> <td>1</td> <td>1</td> <td>1</td> <td>0</td> <td>0</td> </tr> </tbody> </table> <p>In this table the byte returned would be 156 (0x9c).</p> <p>The values will only make sense if the particular channel is set to an input. Channels that are set to an output should be ignored.</p> <p>The host program can mask off the appropriate bits to obtain the required value.</p>	IO8	IO7	IO6	IO5	IO4	IO3	IO1	IO1	1	0	0	1	1	1	0	0
IO8	IO7	IO6	IO5	IO4	IO3	IO1	IO1														
1	0	0	1	1	1	0	0														

I2C or Serial GPIO with PWM**P015/6**

				<p>Examples:</p> <p>lg</p> <p>I2C</p> <p>s 3 p</p> <p>or</p> <p>bus.i2c(0x36,[3],1)</p> <p>See www.pichips.co.uk and 'notsmb' for an explanation of the above nomenclature.</p>																
on	4 n	0 - 255		<p>Set whole byte</p> <p>This will set all of the I/O ports at once using a byte value</p> <table border="1"> <thead> <tr> <th>IO8</th> <th>IO7</th> <th>IO6</th> <th>IO5</th> <th>IO4</th> <th>IO3</th> <th>IO1</th> <th>IO1</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>0</td> <td>0</td> <td>1</td> <td>1</td> <td>1</td> <td>0</td> <td>0</td> </tr> </tbody> </table> <p>In this table the byte set is 156 (0x9c). The I/O as a consequence would be set to the above values.</p> <p>Examples:</p> <p>Set I/O as shown above</p> <p>lo156</p> <p>I2C</p> <p>s 4 156 p</p> <p>or</p> <p>bus.i2c(0x34,[4,156],0)</p> <p>See www.pichips.co.uk and 'notsmb' for an explanation of the above nomenclature.</p>	IO8	IO7	IO6	IO5	IO4	IO3	IO1	IO1	1	0	0	1	1	1	0	0
IO8	IO7	IO6	IO5	IO4	IO3	IO1	IO1													
1	0	0	1	1	1	0	0													
pp,n	5 p n	p 1-8 n 0-1		<p>Sets a pin to be either 0 or 1</p> <p>This of course only applies to pins that have been set as an output</p> <p>Example:</p> <p>Set IO-6 to 1</p> <p>lp6,1</p> <p>I2C</p> <p>s 5 6 1 p</p> <p>or</p> <p>bus.i2c(0x34,[5,6,1],0)</p> <p>See www.pichips.co.uk and 'notsmb' for an explanation of the above nomenclature.</p>																
ip	6 p	1-8		<p>Input from individual pin</p> <p>This applies to pins that have been set as an input and will return the value on that pin.</p> <p>Example:</p> <p>Read pin 4</p> <p>li4</p> <p>I2C</p> <p>s 6 4 r g-1 p</p>
